2. Install and adjust the versions of the following Python modules:

- Install ROBERT and its dependencies: `conda install -y -c conda-forge robert`
- Adjust ROBERT version: `pip install robert==1.2.1`
- Install scikit-learn-intelex: `pip install scikit-learn-intelex==2024.7.0`

Miscellaneous

General tips to improve the models and instructions to predict new values.

Some general tips to improve the score

1. Adding meaningful datapoints might help to improve the model. Also, using a uniform population of datapoints across the whole range of y values usually helps to obtain reliable predictions across the whole range. More information about the range of y values used is available in Section C.
2. Adding meaningful descriptors or replacing/deleting the least useful descriptors used might help. Feature importances are gathered in Section D.

How to predict new values with these models?

1. Create a CSV database with the new points, including the necessary descriptors.
 2. Place the CSV file in the parent folder (i.e., where the module folders were created)
 3. Run the PREDICT module as 'python -m robert --predict --csv_test FILENAME.csv'.
 4. The predictions will be shown at the end of the resulting PDF report and will be stored in the last column of two CSV files called MODEL_SIZE_test(_No)_PFI.csv, which are in the PREDICT folder.
